How do energy storage plants augment electrical grids?

Many individual energy storage plants augment electrical grids by capturing excess electrical energy during periods of low demand and storing it in other forms until needed on an electrical grid. The energy is later converted back to its electrical form and returned to the grid as needed.

How do energy storage systems work?

Energy storage systems, like large-scale batteries, are charged by electricity drawn from the power grid during periods of low demand or extra capacity, provided they are not directly connected to their own dedicated energy source. That electricity is stored and held until it's needed, such as during peak usage times, grid disturbances, or outages.
