Let's consider a laptop with a USB-C port that allows both charging and connecting peripherals. Now, let's say I connect a USB-C keyboard to this port. From what I understand, ...

Modern charging of lithium and nickel based batteries starts with a constant current, until a certain voltage and then a constant voltage until the current falls to some level ...

From what I understand, Constant current charging is when you fix the current supplied to a battery and the voltage would vary depending on the battery. Constant Voltage ...

To be clear, I know that constant-current bulk charging is only meant to happen to a certain point, and that the higher voltage will damage the battery if it leads to overcharging. ...

It will just make much more sense to buy a Type-C PD charger if your devices support it, rather than still dealing with the problem of which USB adapters you can use to ...

The charging cycle for lithium ion batteries can be quite complex, especially in the case of multiple cells in series, but typically involves 4 basic steps: Read voltage, if lower than ...

We designed a power board that can deliver 5V and 3V3. Those two voltages are provided by two boost/buck converters that can deliver 3A each. The board accepts power ...

Accordingly to what I've found in several sources (user's manual of electronic devices, various forums, e.t.c.) I shouldn't charge my Li-Ion batteries in cold temperatures ...

Cell phone battery charging is handled through a battery charging IC. Typically a switching regulator that

varies voltage and current in order to charge the battery.

How do I calculate the approximated time for the Charging and Discharging of the battery? Is there any equation available for the purpose? If yes, then please provide me.
