Do hybrid energy storage power stations improve frequency regulation?

To leverage the efficacy of different types of energy storage in improving the frequency of the power grid in the frequency regulation of the power system, we scrutinized the capacity allocation of hybrid energy storage power stations when participating in the frequency regulation of the power grid.

What is dynamic frequency modulation model?

The dynamic frequency modulation model of the whole regional power grid is composed of thermal power units, energy storage systems, nonlinear frequency difference signal decomposition, fire-storage cooperative fuzzy control power distribution, energy storage system output control and other components. What is the frequency modulation of hybrid energy storage?

Under the four control strategies of A, B, C and D, the hybrid energy storage participating in the primary frequency modulation of the unit Δf_m is 0.00194 p.u.Hz, excluding the energy storage system when the frequency modulation Δf_m is 0.00316 p.u.Hz, compared to a decrease of 37.61 %.

Which control scheme is adopted in hybrid energy storage combined thermal power units?

In summary, control scheme D is adopted when hybrid energy storage combined thermal power units are configured to participate in frequency modulation, namely, both flywheel energy storage and lithium battery energy storage adopt an adaptive variable coefficient control strategy to achieve the best effect.
