Can user equipment evade a fake base station attack after detection?

We also implemented and validated link routing to show that the user equipment can evade a fake base station attack after detection. In the implementation,we showed that our scheme reduces the fake base station availability threat impact from an infinite time duration (without our scheme defense) to only 2.93 s (with our scheme defense).

What is a fake base station?

A fake base station is a well-known security issue in mobile networking. The fake base station exploits the vulnerability in the broadcasting message announcing

Does our scheme detect a fake base station?

Against a legitimate base station,our scheme correctly does not detectand blacklist the base station. Against a fake base station persistently withholding the connection,our scheme correctly decides that it is a fake base station,and the false-negative rate is zero.

How accurate is a fake base station?

Our scheme correctly decides the legitimate base station and the fake base station with 100% accuracy,i.e.,our scheme yields 0 (no fake base station) for all of the legitimate base station experiments,and it yields 1 (yes base station) for all of the fake base stations.

To address RBS attacks, it is essential to create a RBS/FBS detection system. In this paper, we proposed three different approaches to detect RBS/FBS, including the user ...

This study investigates the vulnerabilities of 5G networks exploited by FBSs, which hijack communications by mimicking legitimate base stations and compromising user equipment (UE).
