What are supercapacitors & EDLC?

Introduction Supercapacitors are also known as ultracapacitors and electric double-layer capacitors (EDLC) are capacitors with capacitance values greater than any other capacitor type available today. Supercapacitors are breakthrough energy storage and delivery devices that offer millions of times more capacitance than traditional capacitors.

Do supercapacitors use a solid dielectric?

Unlike ordinary capacitors, supercapacitors do not use a conventional solid dielectric, but rather, they use electrostatic double-layer capacitance and electrochemical pseudocapacitance, both of which contribute to the total energy storage of the capacitor.

What is the maximum voltage of a supercapacitor cell?

The maximum supercapacitor cell voltage ranges from 2.5 to 2.7 V. While higher voltages are possible, they come at the cost of a reduced service life. The usual approach is to place cells in series to achieve higher voltages (up to 15 V), but that increases the series equivalent resistance and reduces the total equivalent capacitance.

What are EDLC capacitors?

EDLC capacitors are using high surface synthesized electrodes based on activated carbon, carbon nano-tubes or graphene. Alternatively, the electrodes can be made from cheap "bio-waste" monolithic material with a natural hierarchy of pore sizes such as coconuts, melon rinds, wood, fish scales etc.
