I have a VirtualBox process hanging around which I tried to kill (KILL/ABORT) but without success. The parent pid is 1 (init). top shows the process as D which is documented as ...

Unlike a common emergency power system or standby generator, an uninterruptible power supply can provide nearly instantaneous protection from input power ...

When looking at the process with "ps ax" the stat column is "DI" which means "uninterruptible sleep (usually IO)". Is it possible to find out more details on what the process is ...

What is an uninterruptible power supply (UPS)? An uninterruptible power supply (UPS) is a device that allows a computer to ...

An uninterruptible power supply (UPS) is a device that provides backup power to critical systems in the event of a power failure. Unlike a generator, which can take time to start, ...

As you could read from that answer, setting the current process state to TASK\_UNINTERRUPTIBLE is needed for make schedule() call, performed by that thread, to ...

Yes, you must call set\_current\_state() before calling schedule(), because otherwise the scheduler will not remove the task from the run queue (if you just want to ...

What is an uninterruptible power supply (UPS)? An uninterruptible power supply (UPS) is a device that allows a computer to keep running for at least a short time when ...

An Uninterruptible Power Supply (UPS) is a device that provides backup power to electrical equipment during power outages or fluctuations. It ensures that connected devices ...

For Linux "defunct" and "zombie" processes are the same. From man ps: Processes marked &lt;defunct&gt; are dead processes (so-called "zombies") that remain because ...

Uninterrupted power supplies protect electronics from power disturbances. Acting as a safeguard, a UPS provides backup power and ensures uninterrupted operation of your devices.

An uninterruptible power supply explained is a system designed to provide immediate power backup during outages. It not only supplies backup power but also regulates voltage ...
